

Oracle Developments for Pricing Reconciliation

The objective of this project was to compare information stored in two different sources, Pricefx and Oracle EBS.

The process had several steps

1. Pull data from Pricefx. Using REST APIs. This logic was developed in Groovy and is stored in a different project.
2. Pull data from a remote Oracle EBS database. Using PL SQL scripts. **These scripts are stored in this project.**
3. Store all the information from both applications in a local custom database to verify that all the records created in Pricefx have been correctly sent to Oracle EBS. **The SQL scripts to create the tables for this database are also stored in this project.**

The mail procedure that executes all the import from Oracle EBS is called `xxso_r_recon_build`

this process calls another called `xxso_r_populateebsquotes`. This one pulls the data from Oracle EBS.
